

Pre-Processing and Ingestion

Invoices enter as email attachments via specific Exchange email boxes. They are queued via Service Bus. Azure Functions pick up Invoice documents from Queue, and send them to Document Intelligence for OCR. The OCR'd output as well as original email+attachment is saved to Storage.

Core Agent Components

LLM Service Endpoints are managed here. Agent Code resides here. Agent uses APIM to discover the MCP Tools it has access to, and can call them as-needed. Conversation State Store is stored in Azure CosmosDB, or in Redis as-needed for better performance. LangSmith Cloud stores logging/observability. Everything is deployed via Terraform.

Post-Processing/Data Write APIs

Processed Invoice Records are emitted via Queue, fully decoupling the Agents from the rest of the system. The Azure Function picks up queue items, and calls SAP APIs to insert processed Invoice Records into SAP. Reporting and Summary data is written to CosmosDB, and the "Control Tower" application picks up information there for display.
